# Contents

## 1. Advice on the experiments

# Advice on the experiments

## Variables here

### 1. Factors dependent on the environment

- ▶ Human
- ▶ Smart-phone device
  - ▶ includes orientation. (only considering the tilt  $0^\circ - 90^\circ$ )
  - ▶ We select two heights. Chest and head height, later one tracking when user is on the phone.
- ▶ Bluetooth module.
  - ▶ includes orientation (facing upwards and downwards).
  - ▶ assuming the direction doesn't affect the RSSI values.
  - ▶ malfunctioning chips.

### 2. Factors dependent on the algorithm.

- ▶ Calibration time.
- ▶ Calibration points.

# Advice on the experiments

## Variables here

We need to fix the other variables when performing experiments on one of the variables. How do we do it?

- ▶ We need to keep orientation of the Bluetooth module for 1.a, 1.b, 1.c.
- ▶ For experiments 1.a and 1.b,
  1. We need to select orientation of phone.
  2. Do we select one cardinal direction?

# Advice on the experiments

- ▶ How do we select the test site? Empty, full, or normal?
- ▶ the test and train data are collected months (at least weeks) apart.
- ▶ How often do we need to fingerprint?
- ▶ Can we use Gaussian Processes to predict when to fingerprint?
